

80% of the cold water used at the kitchen sink is for food preparation, cooking, drinking and other beverages that need filtered water! Now you do not have to choose which water to select.....It is all filtered.....

The High Flow of 1.5 gpm with the **Alwaysfresh HFC-1000** eliminates the need for this separate tap most of the time. If additional flow required the **Alwaysfresh HFC-1000-Dual** has 3.0 gpm flow rate. It can be connected inline to the existing cold sink faucet in the kitchen, bath, prep sink, bar, etc. except when using the undercounter chiller which requires a separate tap.

When to use a separate dispensing tap

1. You will have some customers who still prefer to have a separate dispensing tap or those that select the Standard Flow(.75 gpm) SF-1000 system or SC12-RO-150 for their kitchen sink installation.
2. When installing our Undersink Chiller or instant hot System tee off filter water line to a separate tap. Filtered water would still be plumbed to the existing cold sink faucet as shown to the right.
